

Connect Version 7.3 Release Notes

Connect 7.3 supports the following iMIS versions:

Minimum Version	Maximum Version
20.1.1.4	20.2.64.8807

New Features

Connect support for iMIS 2017 through version 20.2.64.8807H

Connect version 7.3 is the only version that supports iMIS 2017.

Resolved Issues

iMIS function incorrectly marked complimentary when subcategory pricing used in etouches.

This update resolves the issue caused when subcategories only are used to define pricing for an event in etouches. The registrant class pricing entries can be incorrect with a valid price that is also marked as complimentary.

Accounting issue when changing a complimentary registration to a paid registration

This update resolves the financial accounting issue with orders and related transactions when updating a complimentary registration to a paid registration.

Changing a complimentary registration to a paid registration by removing the discount does not update iMIS

This update resolves the issue where registrations initially entered as \$0.00 through the use of a discount code in etouches did not have the discount function removed in iMIS when the discount code was removed or modified in etouches to result in a charged registration.

Gaps in Invoice REFERENCE_NUM and INVOICE_NUM Fields on \$0 Registrations

This update resolves the issue causing gaps or missing iMIS Invoice reference and invoice numbers when processing registrations with a zero dollar value.

Country validation

This update resolves the issue where a country name sent from etouches that does not exist in the iMIS country table causes the registration to fail. When this occurs the country in iMIS is set to blank, the country added in etouches updates the iMIS Address 3 field and the transaction is processed successfully. A notification email is sent to the defined contact to alert the organization of the issue.

Object reference not set to an instance of an object Error On GST / PST Group Registrations

This update resolves the referenced error when submitting a complimentary registration within a group booking.

Address Update not updating the Company in Orders

This update resolves the issue causing the company field in the registration (Orders table) to not be updated when changed in etouches.

Exclude log records with null ID from duplicate check

This update resolves the false positive duplicate alert email messages. It also addresses a performance issue related to existing invoice records with a zero reference number.

Known Issues

Fiscal Period On Modifications Increases By 1 Year

This update does not resolve an issue where occasionally the fiscal year field in the Trans table is incorrectly incremented by 1 year when a registration is modified.

How to Receive the Update

Please contact the C Systems Help Desk to coordinate the installation of the 7.3 upgrade and be prepared to advise which staff should receive email notifications.
